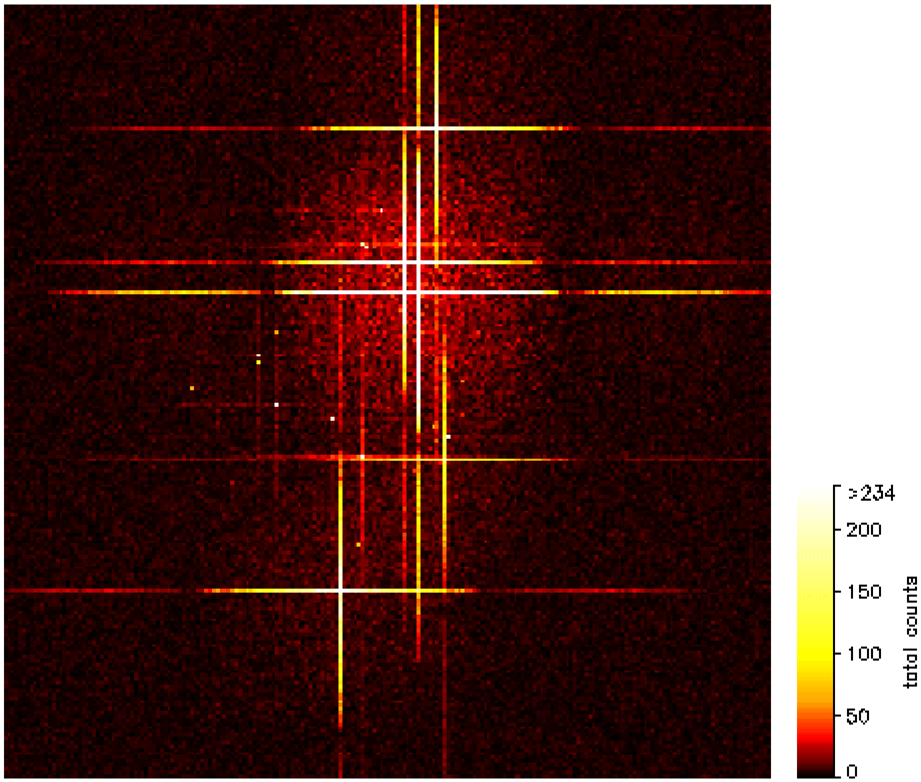
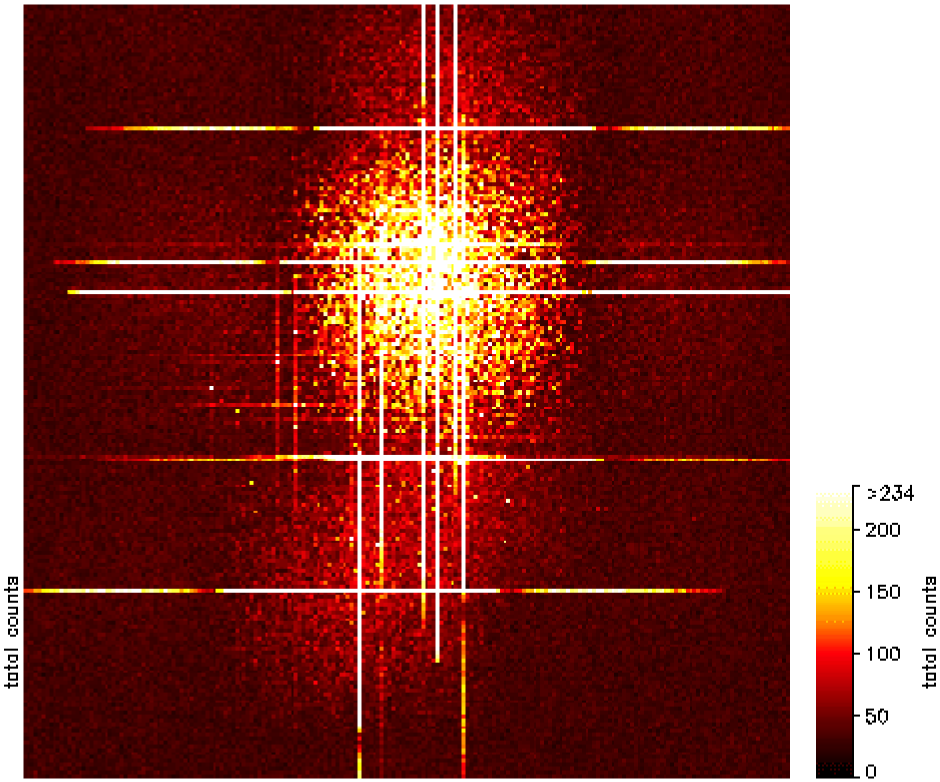
Large Magellenic Cloud - Simulated Images





In a 1-day exposure, sources are visible to the expected limit of 2 x 10^{-12} *erg* cm^{-2} s^{-1} *(0.5-3.5 keV). The angular resolution of about 4 arc-minutes corresponds to 400 µm on the detector. The left picture shows a simulated 1-day exposure; the right, a simulated 10-day exposure.*
